

SAMPLE: Selected Sample Listing (40 BGs)

Detroit Transportation Survey Sample Design

Team Effect Size (Kevin Linares, Tavril Saint Jean)

2026-04-17

This file lists every block group selected for the Detroit Transportation Survey. The sample contains 40 block groups, one per selected tract, drawn via systematic probability-proportional-to-size at both stages. The 21 variables on each row are grouped into four tables below for readability: census counts and composite measure of size, selection probabilities at each stage, within-BG person sampling rates by age domain, and base weights.

Census counts and composite MOS

Table 1

Selection probabilities

The joint BG inclusion probability satisfies $\pi_{ij} = \pi_i \cdot \pi_{j|i}$. For tracts containing only one block group, $\pi_{j|i} = 1$ and the BG selection is deterministic.

Within-BG domain sampling rates and expected workload

The within-BG rate for domain d is $\pi_{k|ij}(d) = \bar{q}f_d/S_{ij}$. Field teams apply these rates directly rather than rounding to integer counts. The expected workload column is the number of persons to contact in each BG, which equals $\bar{q} \approx 53.86$ by design.

Base weights

The BG-level base weight is $d_{0,ij} = 1/\pi_{ij}$. The person-level base weight in domain d is $d_0(d) = 1/f_d = N_d/n_d^{\text{select}}$, which is constant within each domain and thus identical across all 40 rows.
